PROFESSIONAL SUMMARY

Capital markets professional with 4+ years across trade surveillance, exchange operations, and compliance technology at institutional financial services firms. Combines hands-on ownership of EMEA surveillance alert refinement and quality improvement — tuning thresholds, reducing false positive rates, and driving disposition outcomes across equities, ETD, fixed income, and forex using SMARTS — with direct implementation of exchange-level risk parameters at NSE. Independently builds and operates algorithmic trading systems and applied ML models on market data, bridging deep domain expertise with Python, SQL, and data engineering skills relevant to fintech, risk, and markets technology roles.

CORE COMPETENCIES

Trade Surveillance (SMARTS) · Market Abuse Typologies · Alert Review & Disposition · ETD · Equities · Fixed Income · Forex · Exchange Operations & Controls · Trade Operations · Regulatory Inquiry Response · SEBI / NSE Frameworks · UAT & Control Validation · Business & Systems Analysis · Python · SQL · Excel · Power BI · Machine Learning (Sklearn) · QWEST · Trade Explorer

WORK EXPERIENCE

Compliance Associate — Trade & Communication Surveillance

Morgan Stanley

May 2025 – Nov 2025

- Owned EMEA surveillance alert quality across equities, ETD, fixed income, forex, and swaps — running threshold and sweep filter analyses to measure false positive rates, reviewing alert samples, and driving iterative parameter refinements to improve signal precision across 100–150 daily SMARTS alerts.
- Led market abuse investigations across spoofing, front running, insider trading, and marking the close — reconstructing complex trade timelines across SMARTS, QWEST, and Trade Explorer to produce structured case findings for escalation and potential disciplinary referral.
- Built a Python-based validation automation reducing manual surveillance review effort by ~40%; conducted closure-code and data-quality audits to reinforce control consistency and strengthen regulatory inquiry preparedness.

Deputy Manager — Trade Operations & Surveillance Controls

National Stock Exchange of India (NSE)

Mar 2024 – Apr 2025

- Directly implemented exchange-level risk and surveillance parameter changes on the NSE trading system — including price bands, quantity freeze limits, operating range thresholds, and circuit-breaker configurations — in response to SEBI regulatory requirements, market liquidity changes, corporate actions, and broker-level adjustments.
- Investigated abnormal trading events involving price threshold breaches, order-limit violations, and market protection triggers — classifying severity, documenting root cause findings, and driving resolution across operations and technology teams.
- Owned end-to-end UAT and post-deployment validation for surveillance system upgrades — designing test cases, identifying defects, and signing off on parameter changes in collaboration with technology and business stakeholders.

Analyst — Exchange Fee & Billing Analytics (Contract)

Goldman Sachs

Jan 2023 – Sep 2023

- Managed exchange fee and billing analysis across U.S. and European equities — delivering accurate fee calculations, control-focused reconciliations, and structured reporting across compliance-adjacent operational workflows.
- Developed accrual and estimation models using historical volumes and fee schedules to drive data-driven review and reporting consistency.

Process Analyst — Trade Operations & Controls

Broadridge Financial Solutions

Sep 2021 – Dec 2022

- Resolved transaction mismatches by analysing settlement history, corporate action records, and trade data — coordinating findings with operations and compliance teams.
- Validated new securities onboarding and transaction flows through structured readiness checks and control-focused process reviews.

SELECTED PROJECTS

Intraday Regime Clustering & Position Sizing Framework (Python, Sklearn)

- Designed and executed a three-pass K-Means clustering study on 10 years of Nifty 50 intraday data (~2,500 trading days) to classify day-types by quality and identify low-quality regimes driving disproportionate losses.

- Engineered exclusively ex-ante features — observable at entry time — enabling the regime classifier to operate as a live pre-trade signal; deployed as a position-sizing filter (reduced size in weak regimes, full size in strong).
- Outcome: filtering the weak regime raised profit factor from 1.40 → 1.58 and reduced bad-day frequency, with nested sub-cluster analysis used to isolate the most toxic pocket within the weak regime.

Algorithmic Trading System — Live Deployment (Python, Zerodha Kite API)

- Designed, backtested, and deployed two live intraday options strategies on Nifty 50, each validated across 10+ years and 3,000+ trades with systematic entry, stop-loss, and EOD exit logic.
- Conducted structural parity analysis between live and backtest performance, identifying execution asymmetry root causes and iteratively patching logic bugs to improve live-to-backtest fidelity.

Surveillance Alert Automation (Python)

- Built a rule-driven exception-flagging workflow automating recurring manual surveillance checks — reducing review effort and strengthening audit trail quality across compliance control outputs.

CERTIFICATIONS

IBM Certified Data Science & Machine Learning · IBM Generative AI Engineering · NISM AML — Transaction Monitoring & STR (in progress) · Data Analytics & ML — Boston Institute of Analytics (2026, in progress)

EDUCATION

MBA, International Business — CMS Business School, Jain University, Bengaluru	2020
BBA, General — Swami Vivekananda Subharti University	2018
